Marks Obtained : 40

#### Section 1 : Coding

##### 1. Problem Statement

Camila, a user of a social media platform, is looking to change her password to enhance account security. The platform enforces specific rules for password strength to ensure the safety of user accounts. Camila needs a program that prompts her to enter a new password and throws custom exceptions based on the strength of the password.

Password Strength Criteria:

Weak Password:

Length less than 8 characters.

Medium Password:  
Length 8 or more characters. Missing a mix of uppercase letters, lowercase letters, and digits.

Implement a custom exception, to assist Camila in changing her password

securely. The program should interactively take user input for a new password, categorize its strength, and handle custom exceptions (WeakPasswordException and MediumPasswordException) if the password fails to meet the specified criteria.

### ***Input Format***

The input consists of a string *s*, representing the new password.

### ***Output Format***

The output is displayed in the following format:

If the entered password meets the strength criteria, the program outputs

"Password changed successfully!"

If the entered password is weak, the program outputs

"Error: Weak password. It must be at least 8 characters long."

If the entered password is of medium strength, the program outputs

"Error: Medium password. It must include a mix of uppercase letters, lowercase letters, and digits."

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: ComplexP@ss1

Output: Password changed successfully!

### ***Answer***

```
import java.util.*;
```

```
public class Main {
```

```
    static class WeakPasswordException extends Exception {  
        public WeakPasswordException(String message) {  
            super(message);
```

```

    }
}

static class MediumPasswordException extends Exception {
    public MediumPasswordException(String message) {
        super(message);
    }
}

public static void validatePassword(String password)
    throws WeakPasswordException, MediumPasswordException {

    if (password.length() < 8) {
        throw new WeakPasswordException("Weak password. It must be at least
8 characters long.");
    }

    boolean hasUpper = false, hasLower = false, hasDigit = false;

    for (char c : password.toCharArray()) {
        if (Character.isUpperCase(c)) hasUpper = true;
        if (Character.isLowerCase(c)) hasLower = true;
        if (Character.isDigit(c)) hasDigit = true;
    }

    if (!(hasUpper && hasLower && hasDigit)) {
        throw new MediumPasswordException("Medium password. It must
include a mix of uppercase letters, lowercase letters, and digits.");
    }

    System.out.println("Password changed successfully!");
}

public static void main(String[] args) {
    Scanner sc = new Scanner(System.in);
    String password = sc.nextLine();
    sc.close();

    try {
        validatePassword(password);
    } catch (WeakPasswordException e) {
        System.out.println("Error: " + e.getMessage());
    }
}

```

```
} catch (MediumPasswordException e) {  
    System.out.println("Error: " + e.getMessage());  
}  
}  
}
```

**Status :** Correct

**Marks :** 10/10

## 2. Problem Statement

Alice is designing a program that requires users to enter positive numbers. She wants to implement a solution that validates whether the entered number is positive. In case the input is not a positive number, she wants to throw a custom exception.

The number should be a positive integer. If this condition is violated, the program should throw a custom exception: `InvalidPositiveNumberException` with the message "Invalid input. Please enter a positive integer."

Implement a custom exception, `InvalidPositiveNumberException`, to handle cases where the entered number does not meet the specified criteria.

### **Input Format**

The input consists of an integer value 'n', representing the entered number.

### **Output Format**

The output is displayed in the following format:

If the validation passes, print

"Number {number} is positive."

The {number} represents the entered positive integer.

If the entered number is negative then it displays

"Error: Invalid input. Please enter a positive integer."

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 100

Output: Number 100 is positive.

### **Answer**

```
import java.util.*;

public class Main {

    static class InvalidPositiveNumberException extends Exception {
        public InvalidPositiveNumberException(String message) {
            super(message);
        }
    }

    public static void validateNumber(int number) throws
    InvalidPositiveNumberException {
        if (number <= 0) {
            throw new InvalidPositiveNumberException("Invalid input. Please enter a
            positive integer.");
        } else {
            System.out.println("Number " + number + " is positive.");
        }
    }

    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        int n = sc.nextInt();
        sc.close();

        try {
            validateNumber(n);
        } catch (InvalidPositiveNumberException e) {
            System.out.println("Error: " + e.getMessage());
        }
    }
}
```

Status : Correct

Marks : 10/10

### 3. Problem Statement

Hemanth is designing a banking system for XYZ Bank. The system should allow customers to perform deposit, withdrawal, and balance inquiry operations. Implement exception handling for scenarios involving invalid transaction amounts or insufficient funds.

Create two custom exception classes, `InvalidAmountException` and `InsufficientFundsException`, both extending the `Exception` class. Throw an `InvalidAmountException` with a message if the deposit amount is less than or equal to zero. Throw an `InsufficientFundsException` if the withdrawal amount is greater than the available balance. Deduct the withdrawal amount from the balance if the withdrawal is successful.

Assist Hemanth in designing the program.

#### ***Input Format***

The first line of input consists of a double value B, representing the initial balance.

The second line consists of a double value D, representing the deposit amount.

The third line consists of a double value W, representing the withdrawal amount.

#### ***Output Format***

If the withdrawal is successful, print the amount withdrawn and the current balance, rounded off to one decimal place.

If an `InvalidAmountException` occurs, print "Error: [D] is not valid".

If an `InsufficientFundsException` occurs, print "Error: Insufficient funds".

Refer to the sample output for formatting specifications.

#### ***Sample Test Case***

Input: 1050.1

270.2

150.3

Output: Amount Withdrawn: 150.3

Current Balance: 1170.0

### **Answer**

```
import java.util.*;
```

```
public class Main {
```

```
    static class InvalidAmountException extends Exception {  
        public InvalidAmountException(String message) {  
            super(message);  
        }  
    }
```

```
    static class InsufficientFundsException extends Exception {  
        public InsufficientFundsException(String message) {  
            super(message);  
        }  
    }
```

```
    static class BankAccount {  
        private double balance;
```

```
        public BankAccount(double initialBalance) {  
            this.balance = initialBalance;  
        }
```

```
        public void deposit(double amount) throws InvalidAmountException {  
            if (amount <= 0) {  
                throw new InvalidAmountException(amount + " is not valid");  
            }  
            balance += amount;  
        }
```

```
        public void withdraw(double amount) throws InsufficientFundsException {  
            if (amount > balance) {  
                throw new InsufficientFundsException("Insufficient funds");  
            }  
            balance -= amount;  
        }
```

```

    }

    public double getBalance() {
        return balance;
    }
}

public static void main(String[] args) {
    Scanner sc = new Scanner(System.in);
    double initialBalance = sc.nextDouble();
    double depositAmount = sc.nextDouble();
    double withdrawAmount = sc.nextDouble();
    sc.close();

    BankAccount account = new BankAccount(initialBalance);

    try {
        account.deposit(depositAmount); // Try deposit
        account.withdraw(withdrawAmount); // Try withdrawal
        System.out.printf("Amount Withdrawn: %.1f Current Balance: %.1f%n",
            withdrawAmount, account.getBalance());
    }
    catch (InvalidAmountException e) {
        System.out.println("Error: " + e.getMessage());
    }
    catch (InsufficientFundsException e) {
        System.out.println("Error: " + e.getMessage());
    }
}
}

```

**Status :** Correct

**Marks :** 10/10

#### 4. Problem Statement

A company is developing a user registration system that requires users to provide valid email addresses. The development team is implementing an EmailValidator program to ensure that the entered email addresses meet certain criteria using exception handling.

The email address must contain the "@" symbol. The email address must consist of a non-empty username (before "@" symbol) and a non-empty domain (after "@" symbol). The domain part of the email address must contain at least one period ("."). The email address must not contain leading or trailing spaces.

Implement a custom exception, `InvalidEmailException`, to fulfill the company's requirements and validate it according to the specified rules.

### ***Input Format***

The input consists of a string value 's', which represents the email address.

### ***Output Format***

The output is displayed in the following format:

If the entered email address is valid according to the specified rules, the program prints:

"Email address is valid!"

If the entered email address misses the username or domain part or misses "@" symbol or has two or more "@" symbols or misses '.' in the domain part it outputs:

"Error: Invalid email format."

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: johndoe@example.com

Output: Email address is valid!

### ***Answer***

```
import java.util.*;
```

```
public class Main {
```

```
    static class InvalidEmailException extends Exception {
```

```

public InvalidEmailException(String message) {
    super(message);
}

public static void validateEmail(String email) throws InvalidEmailException {
    email = email.trim();

    int atCount = email.length() - email.replace("@", "").length();
    if (atCount != 1) {
        throw new InvalidEmailException("Invalid email format.");
    }

    String[] parts = email.split("@");

    if (parts.length != 2 || parts[0].isEmpty() || parts[1].isEmpty()) {
        throw new InvalidEmailException("Invalid email format.");
    }

    if (!parts[1].contains(".")) {
        throw new InvalidEmailException("Invalid email format.");
    }

    System.out.println("Email address is valid!");
}

public static void main(String[] args) {
    Scanner sc = new Scanner(System.in);
    String email = sc.nextLine();
    sc.close();

    try {
        validateEmail(email);
    } catch (InvalidEmailException e) {
        System.out.println("Error: " + e.getMessage());
    }
}

```

#### Section 1 : Coding

##### 1. Problem Statement

An HR software system is being developed to process employee payrolls. During payroll processing, the system must ensure that no employee has a negative salary and that no employee's salary exceeds 2,00,000. If either condition occurs, the system should throw a custom exception.

Create a custom exception InvalidSalaryException and a class Employee that processes salary according to the following rules:

If salary < 0, throw InvalidSalaryException with the message: "Salary cannot be negative". If salary > 200000, throw InvalidSalaryException with the message: "Salary exceeds threshold limit". Otherwise, display: "Salary processed successfully for <empName>: <salary>".

The payroll processing should always display: "Payroll process completed"

at the end, regardless of whether an exception occurs.

### ***Input Format***

The first line of input contains an integer representing the employee ID.

The second line contains a string representing the employee's name.

The third line contains a floating-point number representing the salary of the employee.

### ***Output Format***

If the salary is valid: "Salary processed successfully for <empName>: <salary>"

"Payroll process completed"

If the salary is invalid: "<Exception Message>"

"Payroll process completed"

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 101

Rahul

150000.0

Output: Salary processed successfully for Rahul: 150000.0

Payroll process completed

### ***Answer***

```
import java.util.*;
```

```
public class Main {
```

```
    static class InvalidSalaryException extends Exception {
```

```
        public InvalidSalaryException(String message) {
```

```
            super(message);
```

```
        }
```

```
    }
```

```

static class Employee {
    int empId;
    String empName;
    double salary;

    public Employee(int empId, String empName, double salary) {
        this.empId = empId;
        this.empName = empName;
        this.salary = salary;
    }

    public void processSalary() throws InvalidSalaryException {
        if (salary < 0) {
            throw new InvalidSalaryException("Salary cannot be negative");
        } else if (salary > 200000) {
            throw new InvalidSalaryException("Salary exceeds threshold limit");
        } else {
            System.out.println("Salary processed successfully for " + empName + ":
" + salary);
        }
    }
}

public static void main(String[] args) {
    Scanner sc = new Scanner(System.in);

    int empId = sc.nextInt();
    String empName = sc.next();
    double salary = sc.nextDouble();
    sc.close();

    Employee emp = new Employee(empId, empName, salary);

    try {
        emp.processSalary();
    } catch (InvalidSalaryException e) {
        System.out.println(e.getMessage());
    } finally {
        System.out.println("Payroll process completed");
    }
}

```

```
}
```

**Status :** Correct

**Marks :** 10/10

## 2. Problem Statement

Enigma is developing a simple web application that takes a user-input URL, validates it, and throws a custom exception `InvalidURLException` if the URL does not start with "http://" or "https://".

The main method prompts the user for input, validates the URL, and prints whether it is valid or not.

### **Input Format**

The input consists of a string, representing the URL entered by the user.

### **Output Format**

The output displays one of the following results:

If the entered URL is valid according to the specified format, the program prints:

"[URL] is a valid URL"

If the entered URL is not valid according to the specified format, the program prints:

"Invalid URL format: [URL]"

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: http://www.example.com

Output: http://www.example.com is a valid URL

**Answer**

```
import java.util.*;

public class Main {

    static class InvalidURLExceptionFormatException extends Exception {
        public InvalidURLExceptionFormatException(String message) {
            super(message);
        }
    }

    public static void validateURL(String url) throws InvalidURLExceptionFormatException {
        if (!(url.startsWith("http://") || url.startsWith("https://"))) {
            throw new InvalidURLExceptionFormatException("Invalid URL format");
        }
    }

    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        String url = sc.nextLine();
        sc.close();

        try {
            validateURL(url);
            System.out.println(url + " is a valid URL");
        } catch (InvalidURLExceptionFormatException e) {
            System.out.println("Invalid URL format: " + url);
        }
    }
}
```

**Status :** Correct

**Marks :** 10/10

### 3. Problem Statement

You are tasked to create a program that defines a custom exception GradeException. The program should include a Student class with fields for the student's name, age, and grade. Implement a method in the Student class that checks the grade, and if the grade is below 40, it should throw a

GradeException. Otherwise, it should display the student's details.

### ***Input Format***

The input consists of three parameters in separate lines:

1. A string representing the student's name.
2. An integer representing the student's age.
3. An integer representing the student's grade.

### ***Output Format***

The output will display the student's details if the grade is valid.

If the grade is below 40, the program will display an error message "Grade is below 40".

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: Alice

20

85

Output: Name: Alice

Age: 20

Grade: 85

### ***Answer***

```
import java.util.*;
```

```
public class Main {
```

```
    static class GradeException extends Exception {  
        public GradeException(String message) {  
            super(message);  
        }  
    }
```

```
    static class Student {  
        String name;
```

```

int age;
int grade;

public Student(String name, int age, int grade) {
    this.name = name;
    this.age = age;
    this.grade = grade;
}

public void checkGrade() throws GradeException {
    if (grade < 40) {
        throw new GradeException("Grade is below 40");
    } else {
        System.out.println("Name: " + name + " Age: " + age + " Grade: " +
grade);
    }
}

}

public static void main(String[] args) {
    Scanner sc = new Scanner(System.in);

    String name = sc.next();
    int age = sc.nextInt();
    int grade = sc.nextInt();
    sc.close();

    Student student = new Student(name, age, grade);

    try {
        student.checkGrade();
    } catch (GradeException e) {
        System.out.println(e.getMessage());
    }
}
}

```

**Status :** Correct

**Marks :** 10/10

#### 4. Problem Statement

Daniel is developing a program to verify the age of users. He wants to ensure that the entered age is within a valid range. Write a program to help Daniel implement this age-checking feature using custom exceptions.

Daniel needs a program that takes an integer input representing a person's age. If the age is between 0 and 150 (inclusive), the program should print "Age is valid!". If the age is less than 0 or greater than 150, the program should throw a custom exception (InvalidAgeException) with the message "Invalid age. Please enter an age between 0 and 150."

Implement a custom exception, InvalidAgeException, to handle cases where the entered age does not meet the specified criteria.

#### ***Input Format***

The input consists of an integer value 'n', representing the age.

#### ***Output Format***

The output is displayed in the following format:

If the age is valid (between 0 and 150, inclusive), print

"Age is valid!".

If the age is invalid, print

"Error: Invalid age. Please enter an age between 0 and 150."

Refer to the sample output for formatting specifications.

#### ***Sample Test Case***

Input: 45

Output: Age is valid!

#### ***Answer***

```
import java.util.*;  
  
public class Main {
```

```

static class InvalidAgeException extends Exception {
    public InvalidAgeException(String message) {
        super(message);
    }
}

public static void validateAge(int age) throws InvalidAgeException {
    if (age < 0 || age > 150) {
        throw new InvalidAgeException("Invalid age. Please enter an age between
0 and 150.");
    } else {
        System.out.println("Age is valid!");
    }
}

public static void main(String[] args) {
    Scanner sc = new Scanner(System.in);
    int age = sc.nextInt();
    sc.close();

    try {
        validateAge(age);
    } catch (InvalidAgeException e) {
        System.out.println("Error: " + e.getMessage());
    }
}
}

```

##### 1. Problem Statement

In a file management system, users are required to provide a valid file name when creating new files. The system enforces specific rules for file names to maintain consistency and avoid potential issues. Your task is to implement a Java program named FileNameValidator that takes user input for a file name and validates it according to the specified rules.

Rules for Valid File Name:

The file name must consist of alphanumeric characters (letters and digits) only. The file name must have a minimum length of 3 characters.

Implement a custom exception, FileNameValidator, to handle cases where the entered filename does not meet the specified criteria.

***Input Format***

The input consists of a string S, representing the desired filename.

### **Output Format**

The output is displayed in the following format:

If the entered file name meets the specified criteria, the program outputs

"Valid file name"

If the entered file name does not meet the criteria and triggers the InvalidFileNameException, the program outputs

"Error: Invalid file name. It must be alphanumeric and have a minimum length of 3 characters."

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: myfile123

Output: Valid file name

### **Answer**

```
import java.util.*;

public class Main {

    static class InvalidFileNameException extends Exception {
        public InvalidFileNameException(String message) {
            super(message);
        }
    }

    public static void validateFileName(String fileName) throws
    InvalidFileNameException {
        if (fileName.length() < 3 || !fileName.matches("[A-Za-z0-9]+")) {
            throw new InvalidFileNameException("Invalid file name");
        }
    }
}
```

```
public static void main(String[] args) {
    Scanner sc = new Scanner(System.in);
    String fileName = sc.nextLine();
    sc.close();

    try {
        validateFileName(fileName);
        System.out.println("Valid file name");
    } catch (InvalidFileNameException e) {
        System.out.println("Error: Invalid file name. It must be alphanumeric and
have a minimum length of 3 characters.");
    }
}

##### 1. Problem Statement

A local municipality is implementing an online voting system for a community event and wants to ensure that only eligible voters (those aged 18 or older) can participate.

Your task is to develop a program that validates the age of individuals attempting to vote online. If the user's age is below 18, the program should throw a custom exception, `InvalidAgeException`, preventing them from casting their vote. If the input is invalid, catch the appropriate `InputMismatchException` and print the in-built exception message.

##### ***Input Format***

The input consists of an integer representing the age.

##### ***Output Format***

If the age is 18 or older, print "Eligible to vote"

If the age is below 18, print "Exception occurred: InvalidAgeException: Age is not valid to vote"

If there is any other type of exception, print "An error occurred: " followed by the in-built exception message.

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 20

Output: Eligible to vote

### **Answer**

```
import java.util.*;

public class Main {

    static class InvalidAgeException extends Exception {
        public InvalidAgeException(String message) {
            super(message);
        }
    }

    public static void validateAge(int age) throws InvalidAgeException {
        if (age < 18) {
            throw new InvalidAgeException("Age is not valid to vote");
        }
    }

    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        try {
            int age = sc.nextInt();
            validateAge(age);
            System.out.println("Eligible to vote");
        }
        catch (InvalidAgeException e) {
```

```
        System.out.println("Exception occurred: InvalidAgeException: " +  
e.getMessage());  
    }  
    catch (InputMismatchException e) {  
        System.out.println("An error occurred: " + e.getClass().getName());  
    }  
    catch (Exception e) {  
        System.out.println("An error occurred: " + e.getMessage());  
    }  
    finally {  
        sc.close();  
    }  
    }  
}
```

Marks Obtained : 10

#### Section 1 : Coding

##### 1. Problem Statement

In a user registration system, there is a requirement to implement a username validation module. Users attempting to register must adhere to specific criteria for their usernames to be considered valid.

Your task is to develop a program that takes user input for a desired username and validates it according to the following rules:

The username must not contain any spaces. The username must be at least 5 characters long.

Implement a custom exception, `InvalidUsernameException`, to handle cases where the entered username does not meet the specified criteria.

##### ***Input Format***

The input consists of a string S, representing the desired username.

### **Output Format**

If the username is valid, print "Username is valid: [S]".

If the username is invalid:

1. If the username is short, print "Invalid Username: Username must be at least 5 characters long"
2. If the username contains spaces, print "Invalid Username: Username cannot contain spaces"

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: John

Output: Invalid Username: Username must be at least 5 characters long

### **Answer**

```
import java.util.*;

public class Main {

    static class InvalidUsernameException extends Exception {
        public InvalidUsernameException(String message) {
            super(message);
        }
    }

    public static void validateUsername(String username) throws
    InvalidUsernameException {
        if (username.contains(" ")) {
            throw new InvalidUsernameException("Username cannot contain
spaces");
        } else if (username.length() < 5) {
            throw new InvalidUsernameException("Username must be at least 5
characters long");
        }
    }
}
```

```
public static void main(String[] args) {  
    Scanner sc = new Scanner(System.in);  
    String username = sc.nextLine();  
    sc.close();  
  
    try {  
        validateUsername(username);  
        System.out.println("Username is valid: " + username);  
    } catch (InvalidUsernameException e) {  
        System.out.println("Invalid Username: " + e.getMessage());  
    }  
}
```

### 2028\_REC\_OOPS using Java\_Week 8\_Q2

Attempt : 1  
Total Mark : 10  
Marks Obtained : 10

#### Section 1 : Coding

##### 1. Problem Statement

Elsa, a busy professional, is using a scheduling application to plan her meetings efficiently. The application requires users to input meeting durations in minutes, ensuring that the duration is a positive integer and does not exceed 240 minutes (4 hours). Elsa needs a program to assist her in scheduling meetings securely with proper exception handling.

Create a Java class named ElsaMeetingScheduler. Implement a custom exception: InvalidDurationException for invalid meeting duration entries. Implement the main method to interactively take user input for a meeting duration. Implement the validateMeetingDuration method to validate the meeting duration based on the specified rules and throw a custom exception if the validation fails. Print appropriate success or error messages based on the meeting duration.

Implement a custom exception, `InvalidDurationException`, to handle cases where the entered meeting duration does not meet the specified criteria.

### ***Input Format***

The input consists of an integer value 'n', representing the meeting duration.

### ***Output Format***

The output is displayed in the following format:

If the entered meeting duration meets the specified criteria, the program outputs

"Meeting scheduled successfully!"

If the entered meeting duration is invalid, the program outputs an error message indicating the issue.

"Error: Invalid meeting duration. Please enter a positive integer not exceeding 240 minutes (4 hours)."

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 120

Output: Meeting scheduled successfully!

### ***Answer***

```
import java.util.*;
```

```
public class Main {
```

```
    static class InvalidDurationException extends Exception {  
        public InvalidDurationException(String message) {  
            super(message);  
        }  
    }  
}
```

```
    public static void validateMeetingDuration(int duration) throws  
        InvalidDurationException {
```

```
        if (duration <= 0 || duration > 240) {  
            throw new InvalidDurationException("Invalid meeting duration");  
        }  
    }  
  
    public static void main(String[] args) {  
        Scanner sc = new Scanner(System.in);  
        int duration = sc.nextInt();  
        sc.close();  
  
        try {  
            validateMeetingDuration(duration);  
            System.out.println("Meeting scheduled successfully!");  
        } catch (InvalidDurationException e) {  
            System.out.println("Error: Invalid meeting duration. Please enter a positive  
integer not exceeding 240 minutes (4 hours).");  
        }  
    }  
}
```

## 2024\_28\_III\_OOPS Using Java Lab

### 2028\_REC\_OOPS using Java\_Week 8\_Q1

Attempt : 1  
Total Mark : 10  
Marks Obtained : 10

#### Section 1 : Coding

##### 1. Problem Statement

Write a program to validate the email address and display suitable exceptions if there is any mistake.

Create 3 custom exception classes as below

DotException AtTheRateException DomainException

A typical email address should have a "." character, and a "@" character, and also the domain name should be valid. Valid domain names for practice be 'in', 'com', 'net', or 'biz'.

Display Invalid Dot usage, Invalid @ usage, or Invalid Domain message based on email id.

Get the email address from the user, validate the email by checking the

above-mentioned criteria, and print the validity status of the input email address.

### ***Input Format***

The first line of input contains the email to be validated.

### ***Output Format***

The output prints a Valid email address or an Invalid email address along with the suitable exception

If email ends with . or contains not exactly one . after @, it throws:

DotException: Invalid Dot usage

Invalid email address

If @ appears not exactly once, it throws:

AtTheRateException: Invalid @ usage

Invalid email address

If the part after the last dot is not among accepted domains:

DomainException: Invalid Domain

Invalid email address

If all conditions satisfied then print:

Valid email address

Refer to the sample input and output for format specifications.

### **Sample Test Case**

Input: sample@gmail.com

Output: Valid email address

### **Answer**

```
import java.util.*;

class DotException extends Exception {
    public DotException(String message) {
        super(message);
    }
}

class AtTheRateException extends Exception {
    public AtTheRateException(String message) {
        super(message);
    }
}

class DomainException extends Exception {
    public DomainException(String message) {
        super(message);
    }
}

public class Main {

    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        String email = sc.nextLine();
        sc.close();

        try {
            validateEmail(email);
            System.out.println("Valid email address");
        }
        catch (DotException e) {
```

```

        System.out.println("DotException: " + e.getMessage());
        System.out.println("Invalid email address");
    }
    catch (AtTheRateException e) {
        System.out.println("AtTheRateException: " + e.getMessage());
        System.out.println("Invalid email address");
    }
    catch (DomainException e) {
        System.out.println("DomainException: " + e.getMessage());
        System.out.println("Invalid email address");
    }
}

public static void validateEmail(String email)
    throws DotException, AtTheRateException, DomainException {

    int atCount = email.length() - email.replace("@", "").length();
    if (atCount != 1 || email.startsWith("@") || email.endsWith("@") ||
email.contains("@@")) {
        throw new AtTheRateException("Invalid @ usage");
    }

    if (email.endsWith(".") || email.startsWith(".") || email.contains("..")) {
        throw new DotException("Invalid Dot usage");
    }

    int atIndex = email.indexOf("@");
    int dotIndex = email.lastIndexOf(".");

    if (dotIndex < atIndex || dotIndex == -1) {
        throw new DotException("Invalid Dot usage");
    }

    String domain = email.substring(dotIndex + 1);
    List<String> validDomains = Arrays.asList("in", "com", "net", "biz");
    if (!validDomains.contains(domain)) {
        throw new DomainException("Invalid Domain");
    }
}
}
}

```

**Status : Correct**

### REC\_2028\_OOPS using Java\_Week 8\_MCQ

Attempt : 1  
Total Mark : 15  
Marks Obtained : 15

#### Section 1 : MCQ

1. what is the output of the following code?

```
class MyException extends Exception {  
    public MyException(String message) {  
        super(message);  
    }  
}  
  
class Test {  
    static void check() throws MyException {  
        throw new MyException("Custom Exception Occurred");  
    }  
  
    public static void main(String[] args) {  
        try {  
            check();  
        }  
    }  
}
```

```
} catch (Exception e) {  
    System.out.println(e.getMessage());  
}  
}  
}
```

**Answer**

Custom Exception Occurred

**Status :** Correct

**Marks :** 1/1

2. What is the purpose of a custom exception in Java?

**Answer**

To create user-defined exceptions for specific scenarios

**Status :** Correct

**Marks :** 1/1

3. What will be the output for the following code?

```
class NegativeBalanceException extends Exception {  
    public NegativeBalanceException(String message) {  
        super(message);  
    }  
}  
  
class Test {  
    public static void main(String[] args) {  
        try {  
            double balance = -500;  
            if (balance < 0) {  
                throw new NegativeBalanceException("Balance cannot be  
negative");  
            }  
        } catch (NegativeBalanceException e) {  
            System.out.println("Error: " + e.getMessage());  
        }  
    }  
}
```

```
}
```

**Answer**

Error: Balance cannot be negative

**Status :** Correct

**Marks :** 1/1

4. What will be the output for the following code?

```
class InvalidUsernameException extends Exception {  
    public InvalidUsernameException(String message) {  
        super(message);  
    }  
}  
  
class Test {  
    public static void main(String[] args) {  
        try {  
            String username = "abc";  
            if (username.length() < 5) {  
                throw new InvalidUsernameException("Username must be at  
least 5 characters long");  
            }  
        } catch (InvalidUsernameException e) {  
            System.out.println(e.getMessage());  
        }  
    }  
}
```

**Answer**

Username must be at least 5 characters long

**Status :** Correct

**Marks :** 1/1

5. What will be the output for the following code?

```
class InvalidVotingAgeException extends Exception {  
    public InvalidVotingAgeException(String message) {  
        super(message);  
    }  
}
```

```

    }
}

class Test {
    public static void main(String[] args) {
        try {
            int age = 15;
            if (age < 18) {
                throw new InvalidVotingAgeException("You are not eligible to
vote");
            }
            System.out.println("Eligible to vote");
        } catch (InvalidVotingAgeException e) {
            System.out.println(e.getMessage());
        }
    }
}

```

**Answer**

You are not eligible to vote

**Status :** Correct

**Marks :** 1/1

6. What will be the output for the following code?

```

import java.io.*;

class OutOfStockException extends Exception {
    public OutOfStockException(String message) {
        super(message);
    }
}

class Test {
    public static void main(String[] args) {
        try {
            int stock = 0;
            if (stock == 0) {
                throw new OutOfStockException("Item is out of stock");
            }
        }
    }
}

```

```

    }
    } catch (OutOfStockException e) {
        System.out.println(e.getMessage());
    }
}

```

**Answer**

Item is out of stock

**Status :** Correct

**Marks :** 1/1

7. How do you create an unchecked custom exception?

**Answer**

By extending RuntimeException

**Status :** Correct

**Marks :** 1/1

8. What will be the output of the following code?

```

class MyException extends Exception {
    public MyException() {
        super("Default Exception Message");
    }
}

class Test {
    public static void main(String[] args) {
        try {
            throw new MyException();
        } catch (MyException e) {
            System.out.println(e.getMessage());
        }
    }
}

```

**Answer**

Default Exception Message

**Status :** Correct

**Marks :** 1/1

9. What will be the output for the following code?

```
import java.io.*;

class NegativeAgeException extends Exception {
    public NegativeAgeException(String message) {
        super(message);
    }
}

class Test {
    public static void main(String[] args) {
        try {
            int age = -5;
            if (age < 0) {
                throw new NegativeAgeException("Age cannot be negative");
            }
        } catch (NegativeAgeException e) {
            System.out.println(e.getMessage());
        }
    }
}
```

**Answer**

Age cannot be negative

**Status :** Correct

**Marks :** 1/1

10. What will be the output for the following code?

```
import java.io.*;

class TemperatureTooHighException extends Exception {
    public TemperatureTooHighException(String message) {
        super(message);
    }
}
```

```
}  
class Test {  
    public static void main(String[] args) {  
        try {  
            int temperature = 110;  
            if (temperature > 100) {  
                throw new TemperatureTooHighException("Temperature too  
high");  
            }  
        } catch (TemperatureTooHighException e) {  
            System.out.println(e.getMessage());  
        }  
    }  
}
```

**Answer**

Temperature too high

**Status :** Correct

**Marks :** 1/1

11. Which keyword is used to explicitly throw a custom exception?

**Answer**

throw

**Status :** Correct

**Marks :** 1/1

12. What will happen if a checked custom exception is thrown inside a method without being caught or declared?

**Answer**

Compilation Error

**Status :** Correct

**Marks :** 1/1

13. What will be the output for the following code?

```
import java.io.*;
```

```
class UnderageException extends Exception {  
    public UnderageException(String message) {  
        super(message);  
    }  
}
```

```
class Test {  
    public static void main(String[] args) {  
        try {  
            int age = 17;  
            if (age < 18) {  
                throw new UnderageException("Underage, cannot proceed");  
            }  
        } catch (UnderageException e) {  
            System.out.println(e.getMessage());  
        }  
    }  
}
```

**Answer**

Underage, cannot proceed

**Status :** Correct

**Marks :** 1/1

14. what is the output of the following code?

```
class MyException extends Exception {  
    public MyException(String message) {  
        super(message);  
    }  
}
```

```
class Test {  
    public static void main(String[] args) {  
        try {  
            throw new MyException("Error occurred");  
        }  
    }  
}
```

```
} catch (MyException e) {  
    System.out.println(e);  
}  
}  
}
```

**Answer**

MyException: Error occurred

**Status :** Correct

**Marks :** 1/1

15. Which of the following is true about custom exceptions?

**Answer**

Custom exceptions must extend either Exception or RuntimeException

**Status :** Correct

**Marks :** 1/1
